# Single 8-Channel Analog Multiplexer/Demultiplexer • Dual 4-Channel Analog Multiplexer/Demultiplexer • Triple 2-Channel Analog Multiplexer/Demultiplexer

### **General Description**

The CD4051BC, CD4052BC, and CD4053BC analog multiplexers/demultiplexers are digitally controlled analog switches having low "ON" impedance and very low "OFF" leakage currents. Control of analog signals up to  $15V_{p-p}$  can be achieved by digital signal amplitudes of 3–15V. For example, if  $V_{DD}=5V,\,V_{SS}=0V$  and  $V_{EE}=-5V$ , analog signals from -5V to +5V can be controlled by digital inputs of 0-5V. The multiplexer circuits dissipate extremely low quiescent power over the full  $V_{DD}-V_{SS}$  and  $V_{DD}-V_{EE}$  supply voltage ranges, independent of the logic state of the control signals. When a logical "1" is present at the inhibit input terminal all channels are "OFF".

CD4051BC is a single 8-channel multiplexer having three binary control inputs. A, B, and C, and an inhibit input. The three binary signals select 1 of 8 channels to be turned "ON" and connect the input to the output.

CD4052BC is a differential 4-channel multiplexer having two binary control inputs, A and B, and an inhibit input. The two binary input signals select 1 or 4 pairs of channels to be turned on and connect the differential analog inputs to the differential outputs.

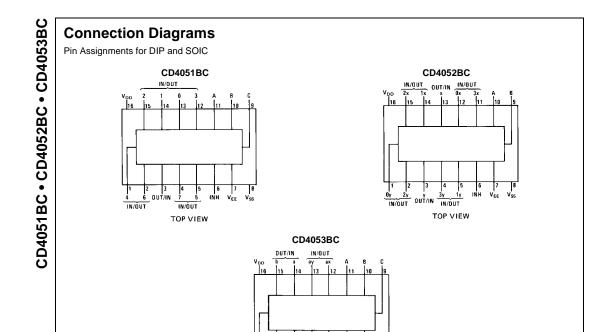

CD4053BC is a triple 2-channel multiplexer having three separate digital control inputs, A, B, and C, and an inhibit input. Each control input selects one of a pair of channels which are connected in a single-pole double-throw configuration.

### Features

- Wide range of digital and analog signal levels: digital 3 – 15V, analog to 15V<sub>p-p</sub>
- Low "ON" resistance: 80Ω (typ.) over entire 15V<sub>p-p</sub> signal-input range for V<sub>DD</sub> V<sub>EE</sub> = 15V
- High "OFF" resistance: channel leakage of ±10 pA (typ.) at V<sub>DD</sub> - V<sub>EE</sub> = 10V
- Logic level conversion for digital addressing signals of  $3 15V (V_{DD} V_{SS} = 3 15V)$  to switch analog signals to  $15 V_{p-p} (V_{DD} V_{EE} = 15V)$
- Matched switch characteristics:  $\Delta R_{ON} = 5\Omega$  (typ.) for V<sub>DD</sub> - V<sub>EE</sub> = 15V
- Very low quiescent power dissipation under all digital-control input and supply conditions: 1 µ W (typ.) at V<sub>DD</sub> - V<sub>SS</sub> = V<sub>DD</sub> - V<sub>EE</sub> = 10V
- Binary address decoding on chip

# Ordering Code:

# Absolute Maximum Ratings(Note 1)

DC Supply Voltage (V <sub>DD</sub> )	–0.5 $V_{DC}$ to +18 $V_{DC}$
Input Voltage (V <sub>IN</sub> )	–0.5 $V_{DC}$ to $V_{DD}$ +0.5 $V_{DC}$
Storage Temperature	
Range (T <sub>S</sub> )	-65°C to +150°C
Power Dissipation (P <sub>D</sub> )	
Dual-In-Line	700 mW
Small Outline	500 mW
Lead Temperature (TL)	
(soldering, 10 seconds)	260°C

### **Recommended Operating** Conditions

DC Supply Voltage (V <sub>DD</sub> )	+5 $V_{DC}$ to +15 $V_{DC}$
Input Voltage (V <sub>IN</sub> )	0V to $V_{DD} V_{DC}$
Operating Temperature Range (T <sub>A</sub> )	

CD4051BC/CD4052BC/CD4053BC

-55°C to +125°C Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be oper-ated at these limits. The Electrical Characteristics tables provide conditions for actual device operation.

### **Special Considerations**

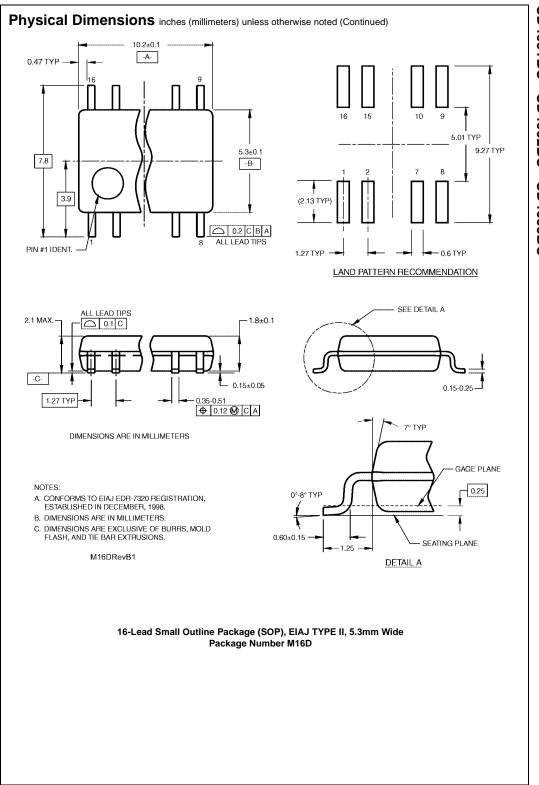

In certain applications the external load-resistor current may include both  $V_{\text{DD}}$  and signal-line components. To avoid drawing  $V_{\text{DD}}$  current when switch current flows into IN/OUT pin, the voltage drop across the bidirectional

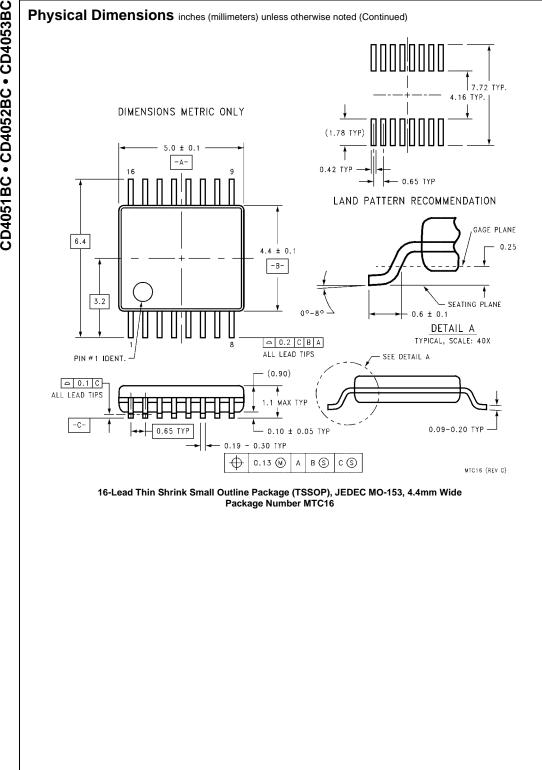

switch must not exceed 0.6V at  $T_A {\leq} 25^\circ C$ , or 0.4V at  $T_A {>} 25^\circ C$  (calculated from  $R_{ON}$  values shown). No  $V_{DD}$  current will flow through  $R_L$  if the switch current flows into OUT/IN pin.
