

### Applications

- Low voltage, high density systems with Intermediate Bus Architectures (IBA)
- Point-of-load regulators for high performance DSP, FPGA, ASIC, and microprocessor applications
- Industrial computing, servers, and storage
- Broadband, networking, optical, and wireless communications systems
- Active memory bus terminators

### Benefits

- Integrates digital power conversion with intelligent power management
- Eliminates the need for external power management components and communication bus
- Completely programmable via pin strapping and one external resistor
- One part that covers all applications
- Reduces board space, system cost and complexity, and time to market

### Description

Power-One's point-of-load converters are recommended for use with regulated bus converters in an Intermediate Bus Architecture (IBA). The ZY2120 is an intelligent, fully programmable step-down point-of-load DC-DC module integrating digital power conversion and power management. The ZY2120 eliminates the need for external components for sequencing, tracking, protection, monitoring, and reporting. Performance parameters of the ZY2120 are programmable by pin strapping and an external resistor, and can be changed by the user at any time during product development and service without a need for a communication bus.

### Features

- RoHS lead free and lead-solder-exempt products are available
- Wide input voltage range: 8V–14V
- High continuous output current: 20A
- Wide programmable output voltage range: 0.5V–5.5V
- Active digital current share
- Output voltage margining
- Overcurrent and overtemperature protections
- Overvoltage and undervoltage protections, and Power Good signal tracking the output voltage setpoint
- Tracking during turn-on and turn-off with guaranteed slew rates
- Sequenced and cascaded modes of operation
- Single-wire line for frequency synchronization between multiple POLs
- Programmable feedback loop compensation
- Differential output voltage sense
- Enable control
- Flexible fault management and propagation
- Start-up into the load pre-biased up to 100%
- Current sink capability
- Real-time current measurements, monitoring, and reporting
- Industry standard size through-hole single-in-line package: 1.6"x0.41"
- Low height of 0.84"
- Wide operating temperature range: 0 to 70°C
- UL 60950-1/CSA 22.2 No. 60950-1-07 Second Edition, IEC 60950-1: 2005, and EN 60950-1:2006

<b>Product family:</b> Z-One Module	<b>Series:</b> No-Bus POL Converter	<b>Output Current:</b> 20A	<b>RoHS compliance:</b> <b>No suffix</b> - RoHS compliant with Pb solder exemption <sup>1</sup> <b>G</b> - RoHS compliant for all six substances	<b>Dash</b>	<b>Packaging Option<sup>2</sup>:</b> <b>R1</b> – 48 pcs Tray <b>Q1</b> – 1 pc sample for evaluation only

<sup>1</sup> The solder exemption refers to all the restricted materials except lead in solder. These materials are Cadmium (Cd), Hexavalent chromium (Cr6+), Mercury (Hg), Polybrominated biphenyls (PBB), Polybrominated diphenylethers (PBDE), and Lead (Pb) used anywhere except in solder.

<sup>2</sup> Packaging option is used only for ordering and not included in the part number printed on the POL converter label.

Example: **ZY2120G-R1**: A 48-piece tray of RoHS compliant POL converters. Each POL converter is labeled ZY2120G.

## 2. Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings may cause performance degradation, adversely affect long-term reliability, and cause permanent damage to the POL converter.

In this application four POL converters are configured to deliver three independent output voltages. POL1 and POL2 are connected in parallel for increased output current. Output voltages are programmed with the resistors connected between TRIM and MARGIN pins of individual converters.

POL1 is configured as a master (IM pin is grounded) and all other POL converters are synchronized to the switching frequency of POL1.

All converters are controlled by the common ENABLE signal. Turn-on and turn-off processes of the system are illustrated by pictures in Figure 4 and Figure 5.

## 8. Pin and Feature Description

### 8.1 OK, Fault Status

The open drain input/output with the internal pull-up resistor. The POL converter pulls its OK pin low, if a fault occurs. Pulling low the OK input by an external circuitry turns off the POL converter.

### 8.2 SYNC, Frequency Synchronization Line

The bidirectional input/output with the internal pull-up resistor. If the POL converter is configured as a master, the SYNC line propagates clock to other POL converters. If the POL converter is configured as a slave, the internal clock recovery circuit synchronizes the POL converter to the clock of the SYNC line.

### 8.3 IM, Interleave Mode

The input with the internal pull-up resistor. When the pin is left floating, the switching frequency is determined by an external clock applied to the SYNC pin. Pulling the IM pin low configures a POL converter as a master. The master determines the clock on the SYNC line.

### 8.4 PG, Power Good

The open drain input/output with the internal pull-up resistor. The pin is pulled low by the POL converter, if the output voltage is outside of the window defined by the Power Good High and Low thresholds.

### 8.5 CCA, Compensation Coefficient Address

Inputs with internal pull-ups to select one of 2 sets of digital filter coefficients optimized for different characteristics of output capacitance.

### 8.6 CS, Current Share/Sense Bus

The open drain digital input/output with the internal pull-up resistor. The duty cycle of the digital signal is proportional to the output current of the POL converter. External capacitive loading of the pin shall be avoided.

### 8.7 MARGIN, Output Voltage Margining

The output of the 2V internal voltage reference that is used to program the output voltage of the POL converter.

### 8.8 TRIM, Output Voltage Trim

The input of the TRIM comparator for the output voltage programming.

The output voltage is programmed by a single resistor connected between MARGIN and TRIM pins.

Table 1. Trim Resistor Values

V <sub>out</sub> [V]	R <sub>TRIM</sub> [kΩ]	The Closest Standard Value [kΩ]
0.50	Open	
0.75	126.7	127
1.0	90	90.9
1.5	53.3	53.6
1.8	41.1	41.2
2.5	24	24.3
3.3	13.3	13.3
5.0	2	2

### 8.9 EN, Enable

The input with the internal pull-up resistor. The POL converter is turned off, when the pin is pulled low

### 8.10 -VS and +VS

The differential voltage input of the POL converter feedback loop.

## 9. Application Information

### 9.1 Output Voltage Programming

Resistance of the trim resistor is determined from the equation below:

$$R_{TRIM} = \frac{20 \times (5.5 - V_{OUT})}{V_{OUT}}, \text{ k}\Omega$$

where  $V_{OUT}$  is the desired output voltage in Volts.

If the  $R_{TRIM}$  is open or the TRIM pin is shorted to PGND, the  $V_{OUT}=0.5V$ .

### 9.2 Output Voltage Margining

Margining can be implemented by changing the resistance between the REF and TRIM pins.

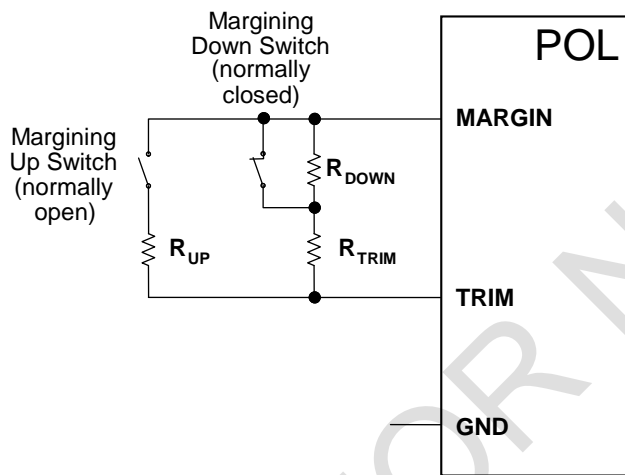

Figure 12. Margining Configuration

In the schematic shown in Figure 12, the nominal output voltage is set with the trim resistor  $R_{TRIM}$  calculated from the equation in the paragraph 9.1. Resistors  $R_{UP}$  and  $R_{DOWN}$  are added to margin the output voltage up and down respectively and determined from the equations below.

$$R_{UP} = \frac{20 \times R_{TRIM}}{20 + R_{TRIM}} \times \left( \frac{5 \times R_{TRIM} - \Delta V\%}{\Delta V\%} \right), \text{ k}\Omega$$

$$R_{DOWN} = (20 + R_{TRIM}) \times \left( \frac{\Delta V\%}{100 - \Delta V\%} \right), \text{ k}\Omega$$

where  $R_{TRIM}$  is the value of the trim resistor in k $\Omega$  and  $\Delta V\%$  is the absolute value of desired margining expressed in percents of the nominal output voltage.

During normal operation the resistors are removed from the circuit by the switches. The “Margining Down” switch is normally closed shorting the resistor  $R_{DOWN}$  while the “Margining Up” switch is normally open disconnecting the resistor  $R_{UP}$ .

An alternative configuration of the margining circuit is shown in Figure 13. In the configuration both switches are normally open that may be advantageous in some implementations.

Figure 13. Alternative Margining Configuration

$R_{UP}$  and  $R_{DOWN}$  for this configuration are determined from the following equations:

$$R_{UP} = \frac{20 \times R_{TRIM}}{20 + R_{TRIM}} \times \left( \frac{5 \times R_{TRIM} - \Delta V\%}{\Delta V\%} \right), \text{ k}\Omega$$

$$R_{DOWN} = \frac{20 \times R_{TRIM}}{20 + R_{TRIM}} \times \left( \frac{100 - \Delta V\%}{\Delta V\%} \right), \text{ k}\Omega$$

**Caution:** Noise injected into the TRIM node may affect accuracy of the output voltage and stability of the POL converter. Always minimize the PCB trace length from the TRIM pin to external components to avoid noise pickup.
