GD4052B

DUAL 4-CHANNEL ANALOG MULTIPLEXER/DEMULTIPLEXER

DESCRIPTION – The 4052B is a Dual 4-Channel Analog Multiplexer/Demultiplexer with common channel select logic. Each Multiplexer/Demultiplexer has four independent inputs/outputs (Y_0–Y_3) and a Common Input/Output (Z). The common channel select logic includes two Address inputs (A_0, A_1) and an active LOW Enable Input ($\overline{E}$).

Both multiplexer/demultiplexers contain four bidirectional analog switches, each with one side connected to an independent Input/Output (Y_0–Y_3) and the other side connected to a Common Input/Output (Z). With the Enable Input LOW, one of the four switches is selected (low impedance, ON state) by the two Address Inputs. With the Enable Input HIGH, all switches are in the high impedance OFF state, independent of the Address Inputs.

V_{DD} and V_{SS} are the two supply voltage connections for the digital control inputs (A_0, A_1, $\overline{E}$). Their voltage limits are the same as for all other digital CMOS. The analog inputs/outputs (Y_0–Y_3, Z) can swing between V_{DD} as a positive limit and V_{EE} as a negative limit. V_{DD}–V_{EE} may not exceed 15 V. For operation as a digital multiplexer/demultiplexer, V_{EE} is connected to V_{SS} (typically ground).

PIN NAMES

Y_{0a}–Y_{3a}	Independent Inputs/Outputs
Y_{0b}–Y_{3b}	Independent Inputs/Outputs
A_0, A_1	Address Inputs
$\overline{E}$	Enable Input (Active LOW)
Z_a, Z_b	Common Input/Output

NOTES:
1. Additional DC Characteristics are listed in this section under 4000B Series CMOS Family Characteristics.
2. $\overline{E}$ = V_{SS}, R_L = 10 kΩ, any channel selected and V_{SS} = V_{EE} or V_{DD}/2.
3. Propagation Delays and Output Transition Times are graphically described in this section under 4000B Series CMOS Family Characteristics.
4. V_{is}/V_{os} is the voltage signal at an Input/Output terminal (Y_n/Z_n).
5. V_{IN} = V_{DD} (Square Wave), Input transition times ≤ 20 ns
6. In certain applications, the current through the external load resistor (R_L) may include both V_{DD} and signal line components. To avoid drawing V_{DD} current when switch current flows into terminals 1, 2, 4, 5, 11, 12, 14, or 15 the voltage drop across the bidirectional switch must not exceed 0.5 V at T_A ≤ 25°C, or 0.3 V at T_A > 25°C. No V_{DD} current will flow through R_L if the switch current flows into terminals 3 or 13.
