DESCRIPTION:

The 16-bit transceivers are built using advanced dual metal CMOS technology. These high-speed, low-power transceivers are ideal for synchronous communication between two busses (A and B). The Direction and Output Enable controls operate these devices as either two independent 8-bit transceivers or one 16-bit transceiver. The direction control pin (xDIR) controls the direction of data flow. The output enable pin (xOE) overrides the direction control and disables both ports. All inputs are designed with hysteresis for improved noise margin.

The FCT16245T are ideally suited for driving high-capacitance loads and low-impedance backplanes. The output buffers are designed with power off disable capability to allow "live insertion" of boards when used as backplane drivers.

The FCT162245T have balanced output drive with current limiting resistors. This offers low ground bounce, minimal undershoot, and controlled output fall times—reducing the need for external series terminating resistors. The FCT162245T are plug-in replacements for the FCT16245T and ABT16245 for on-board interface applications.

The FCT166245T are suited for very low noise, point-to-point driving where there is a single receiver, or a light lumped

- **Features for FCT162H245T/AT/CT/ET:**
 - Bus Hold retains last active bus state during 3-state
 - Eliminates the need for external pull up resistors

DESCRIPTION: (Cont'd.)

load ($< 100\text{pF}$). The buffers are designed to limit the output current to levels which will avoid noise and ringing on the signal lines without using external series terminating resistors. These parts have a $\pm 8\text{mA}$ driver on the "A" Port and a $+64/-32\text{mA}$ driver on the "B" Port, making them ideal for interfacing noisy system busses to noise sensitive interfaces.

The FCT162H245T have "Bus Hold" which retains the input's last state whenever the input goes to high impedance. This prevents "floating" inputs and eliminates the need for pull-up/down resistors.
