Extended Common-Mode RS-485 Transceivers

Check for Samples: SN65HVD20, SN65HVD21, SN65HVD22, SN65HVD23, SN65HVD24

FEATURES

- **Common-Mode Voltage Range (–20 V to 25 V) More Than Doubles TIA/EIA-485 Requirement**
- **Receiver Equalization Extends Cable Length, Signaling Rate (HVD23, HVD24)**
- **Reduced Unit-Load for up to 256 Nodes**
- **Bus I/O Protection to Over 16-kV HBM**
- **Failsafe Receiver for Open-Circuit, Short-Circuit and Idle-Bus Conditions**
- **Low Standby Supply Current 1-µA Max**
- **More Than 100 mV Receiver Hysteresis**

APPLICATIONS

- **Long Cable Solutions**
  - **Factory Automation**
  - **Security Networks**
  - **Building HVAC**
- **Severe Electrical Environments**
  - **Electrical Power Inverters**
  - **Industrial Drives**
  - **Avionics**

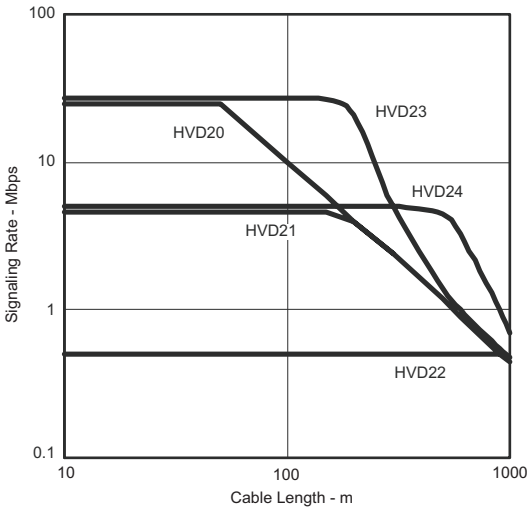
DESCRIPTION

The transceivers in the HVD2x family offer performance far exceeding typical RS−485 devices. In addition to meeting all requirements of the TIA/EIA−485−A standard, the HVD2x family operates over an extended range of common-mode voltage, and has features such as high ESD protection, wide receiver hysteresis, and failsafe operation. This family of devices is ideally suited for long-cable networks, and other applications where the environment is too harsh for ordinary transceivers.

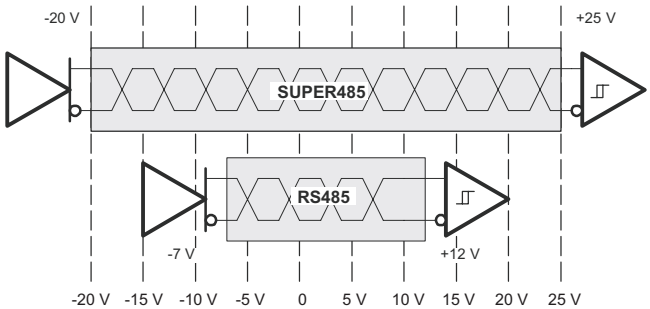
These devices are designed for bidirectional data transmission on multipoint twisted-pair cables. Example applications are digital motor controllers, remote sensors and terminals, industrial process control, security stations, and environmental control systems.

These devices combine a 3-state differential driver and a differential receiver, which operate from a single 5-V power supply. The driver differential outputs and the receiver differential inputs are connected internally to form a differential bus port that offers minimum loading to the bus. This port features an extended common-mode voltage range making the device suitable for multipoint applications over long cable runs.

HVD2x APPLICATION SPACE



HVD2x Devices Operate Over a Wider Common-Mode Voltage Range



Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

DESCRIPTION (CONTINUED)

The ‘HVD20 provides high signaling rate (up to 25 Mbps) for interconnecting networks of up to 64 nodes.

The ‘HVD21 allows up to 256 connected nodes at moderate data rates (up to 5 Mbps). The driver output slew rate is controlled to provide reliable switching with shaped transitions which reduce high-frequency noise emissions.

The ‘HVD22 has controlled driver output slew rate for low radiated noise in emission-sensitive applications and for improved signal quality with long stubs. Up to 256 ‘HVD22 nodes can be connected at signaling rates up to 500 kbps.

The ‘HVD23 implements receiver equalization technology for improved jitter performance on differential bus applications with data rates up to 25 Mbps at cable lengths up to 160 meters.

The ‘HVD24 implements receiver equalization technology for improved jitter performance on differential bus applications with data rates in the range of 1 Mbps to 10 Mbps at cable lengths up to 1000 meters.

The receivers also include a failsafe circuit that provides a high-level output within 250 microseconds after loss of the input signal. The most common causes of signal loss are disconnected cables, shorted lines, or the absence of any active transmitters on the bus. This feature prevents noise from being received as valid data under these fault conditions. This feature may also be used for Wired-Or bus signaling.

The SN65HVD2X devices are characterized for operation over the temperature range of –40°C to 85°C.

PRODUCT SELECTION GUIDE

PART NUMBERS	CABLE LENGTH AND SIGNALING RATE (1)	NODES	MARKING
SN65HVD20	Up to 50 m at 25 Mbps	Up to 64	D: VP20 P: 65HVD20
SN65HVD21	Up to 150 m at 5 Mbps (with slew rate limit)	Up to 256	D: VP21 P: 65HVD21
SN65HVD22	Up to1200 m at 500 kbps (with slew rate limit)	Up to 256	D: VP22 P: 65HVD22
SN65HVD23	Up to 160 m at 25 Mbps (with receiver equalization)	Up to 64	D: VP23 P: 65HVD23
SN65HVD24	Up to 500 m at 3 Mbps (with receiver equalization)	Up to 256	D: VP24 P: 65HVD24

(1) If the differential input V_{ID} remains within the transition range for more than 250 µs, the integrated failsafe circuitry detects a bus fault, and set the receiver output to a high state. See Figure 15.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) (1)

			SN65HVD2X
Supply voltage(2), V_{CC}			–0.5 V to 7 V
Voltage at any bus I/O terminal			–27 V to 27 V
Voltage input, transient pulse, A and B, (through 100 Ω, see Figure 16)			–60 V to 60 V
Voltage input at any D, DE or $\overline{RE}$ terminal			–0.5 V to VCC+ 0.5 V
Receiver output current, I_O			–10 mA to 10 mA
Electrostatic dischargeElectrostatic discharge	Human Body Model(3)	A, B, GND	16 kV
		All pins	5 kV
	Charged-Device Model(4)	All pins	1.5 kV
	Machine Model(5)	All pins	200 V
Continuous total power dissipation			See Thermal Table
Junction temperature, T_J			150°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.
(3) Tested in accordance with JEDEC Standard 22, Test Method A114-A.
(4) Tested in accordance with JEDEC Standard 22, Test Method C101.
(5) Tested in accordance with JEDEC Standard 22, Test Method A115-A

RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
Supply voltage, V_{CC}		4.5	5	5.5	V
Voltage at any bus I/O terminal	A, B	−20		25	V
High-level input voltage, V_{IH}	D, DE, $\overline{RE}$	2		V_{CC}	V
Low-level input voltage, V_{IL}	D, DE, $\overline{RE}$	0		0.8	V
Differential input voltage, V_{ID}	A with respect to B	−25		25	V
Output current	Driver	−110		110	mA
Output current	Receiver	−8		8	mA
Operating free-air temperature, T_A (1)		−40		85	°C
Junction temperature, T_J		−40		130	°C

(1) Maximum free-air temperature operation is allowed as long as the device recommended junction temperature is not exceeded.

DRIVER ELECTRICAL CHARACTERISTICS

over recommended operating conditions

PARAMETER		TEST CONDITIONS		MIN	TYP(1)	MAX	UNIT
V_{IK}	Input clamp voltage	I_I = −18 mA		–1.5	0.75		V
V_O	Open-circuit output voltage	A or B, No load		0		V_{CC}	V
$\lvert V_{OD(SS)}\rvert$	Steady-state differential output voltage	No load (open circuit)		3.3	4.2	V_{CC}	V
		R_L = 54 Ω, See Figure 1		1.8	2.5		V
		With common-mode loading, See Figure 2		1.8			V
$\Delta\lvert V_{OD(SS)}\rvert$	Change in steady-state differential output voltage between logic states	See Figure 1 and Figure 3		–0.1		0.1	V
$V_{OC(SS)}$	Steady-state common-mode output voltage	See Figure 1		2.1	2.5	2.9	V
$\Delta V_{OC(SS)}$	Change in steady-state common-mode output voltage, $V_{OC(H)} – V_{OC(L)}$	See Figure 1 and Figure 4		–0.1		0.1	V
$V_{OC(PP)}$	Peak-to-peak common-mode output voltage, $V_{OC(MAX)} – V_{OC(MIN)}$	R_L = 54 Ω, C_L = 50 pF, See Figure 1 and Figure 4		0.35			V
$V_{OD(RING)}$	Differential output voltage over and under shoot	R_L = 54 Ω, C_L = 50 pF, See Figure 5				10%	
I_I	Input current	D, DE		–100		100	µA
I_O	Output current with power off. High impedance state output current.	V_O < = -7 V to 12 V, Other input = 0 V	HVD20, HVD23	-400		500	µA
			HVD21, HVD22, HVD24	-100		125	µA
		V_O < = -20 V to 25 V, Other input = 0 V	HVD20, HVD23	-800		1000	µA
			HVD21, HVD22, HVD24	-200		250	µA
I_{OS}	Short-circuit output current	V_O = –20 V to 25 V, See Figure 9		–250		250	mA
C_{OD}	Differential output capacitance					20	pF

(1) All typical values are at V_{CC} = 5 V and 25°C.

APPLICATION INFORMATION

THEORY OF OPERATION

The HVD2x family of devices integrates a differential receiver and differential driver with additional features for improved performance in electrically-noisy, long-cable, or other fault-intolerant applications.

The receiver hysteresis (typically 130 mV) is much larger than found in typical RS-485 transceivers. This helps reject spurious noise signals which would otherwise cause false changes in the receiver output state.

Slew rate limiting on the driver outputs (SN65HVD21, 22, and 24) reduces the high-frequency content of signal edges. This decreases reflections from bus discontinuities, and allows longer stub lengths between nodes and the main bus line. Designers should consider the maximum signaling rate and cable length required for a specific application, and choose the transceiver best matching those requirements.

When DE is low, the differential driver is disabled, and the A and B outputs are in high-impedance states. When DE is high, the differential driver is enabled, and drives the A and B outputs according to the state of the D input.s

When $\overline{RE}$ is high, the differential receiver output buffer is disabled, and the R output is in a high-impedance state. When $\overline{RE}$ is low, the differential receiver is enabled, and the R output reflects the state of the differential bus inputs on the A and B pins.

If both the driver and receiver are disabled, (DE low and $\overline{RE}$ high) then all nonessential circuitry, including auxiliary functions such as failsafe and receiver equalization is placed in a low-power standby state. This reduces power consumption to less than 5µW. When either enable input is asserted, the circuitry again becomes active.

In addition to the primary differential receiver, these devices incorporate a set of comparators and logic to implement an active receiver failsafe feature. These components determine whether the differential bus signal is valid. Whenever the differential signal is close to zero volts (neither high nor low), a timer initiates, If the differential input remains within the transition range for more than 250 microseconds, the timer expires and set the receiver output to the high state. If a valid bus input (high or low) is received at any time, the receiver output reflects the valid bus state, and the timer is reset.

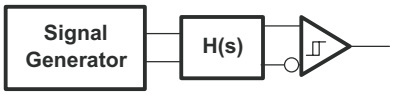

Figure 27. Cable Attenuation Model for Jitter Measurements

INTEGRATED RECEIVER EQUALIZATION USING THE HVD23

Figure 28 illustrates the benefits of integrated receiver equalization as implemented in the HVD23 transceiver. In this test setup, a differential signal generator applied a signal voltage at one end of the cable, which was Belden 3105A twisted-pair shielded cable. The test signal was a pseudo-random bit stream (PRBS) of nonreturn-to-zero (NRZ) data. Channel 1 (top) shows the eye-pattern of the differential voltage at the receiver inputs (after the cable attenuation). Channel 2 (bottom) shows the output of the receiver.

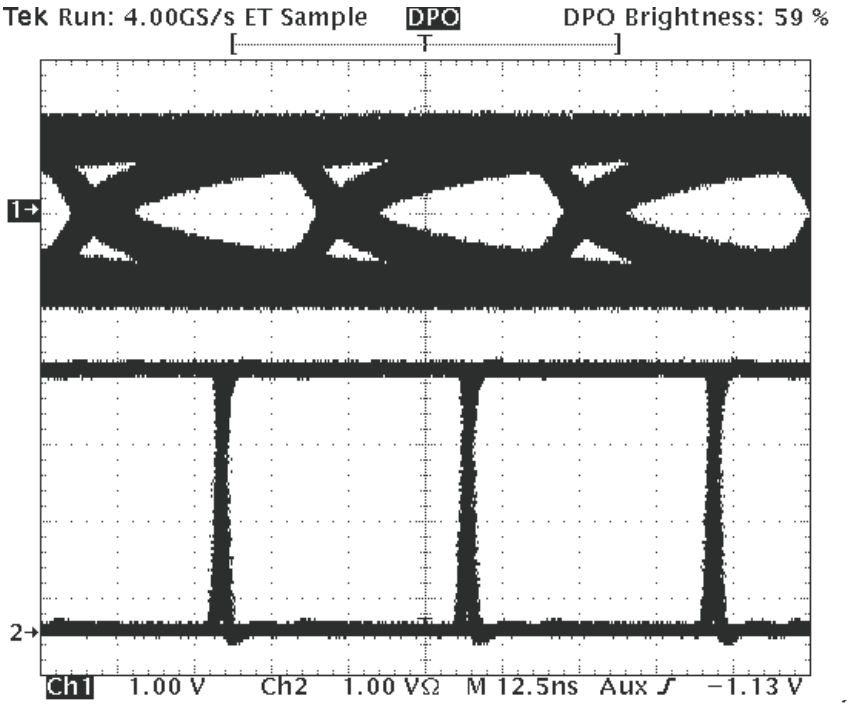

Figure 28. HVD23 Receiver Performance at 25 Mbps Over 150 Meter Cable

INTEGRATED RECEIVER EQUALIZATION USING THE HVD24

Figure 29 illustrates the benefits of integrated receiver equalization as implemented in the HVD24 transceiver. In this test setup, a differential signal generator applied a signal voltage at one end of the cable, which was Belden 3105A twisted-pair shielded cable. The test signal was a pseudo-random bit stream (PRBS) of nonreturn-to-zero (NRZ) data. Channel 1 (top) shows the eye-pattern of the bit stream. Channel 2 (middle) shows the eye-pattern of the differential voltage at the receiver inputs (after the cable attenuation). Channel 3 (bottom) shows the output of the receiver.

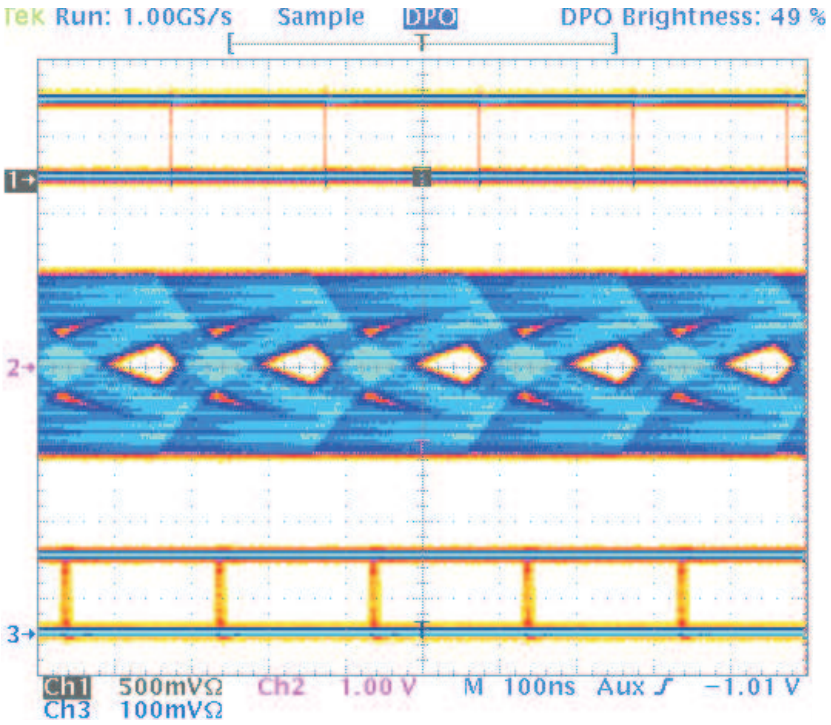

Figure 29. HVD24 Receiver Performance at 5 Mbps Over 500 Meter Cable

NOISE CONSIDERATIONS FOR EQUALIZED RECEIVERS

The simplest way of overcoming the effects of cable losses is to increase the sensitivity of the receiver. If the maximum attenuation of frequencies of interest is 20 dB, increasing the receiver gain by a factor of ten compensates for the cable. However, this means that both signal and noise are amplified. Therefore, the receiver with higher gain is more sensitive to noise and it is important to minimize differential noise coupling to the equalized receiver.

Differential noise is crated when conducted or radiated noise energy generates more voltage on one line of the differential pair than the other. For this to occur from conducted or electric far-field noise, the impedance to ground of the lines must differ.

For noise frequency out to 50 MHz, the input traces can be treated as a lumped capacitance if the receiver is approximately 10 inches or less from the connector. Therefore, matching impedance of the lines is accomplished by matching the lumped capacitance of each.

The primary factors that affect the capacitance of a trace are in length, thickness, width, dielectric material, distance from the signal return path, stray capacitance, and proximity to other conductors. It is difficult to match each of the variables for each line of the differential pair exactly, but a reasonable effort to do so keeps the lines balanced and less susceptible to differential noise coupling.

Another source of differential noise is from near-field coupling. In this situation, an assumption of equal noise-source impedance cannot be made as in the far-field. Familiarly known as crosstalk, more energy from a nearby signal is coupled to one line of the differential pair. Minimization of this differential noise is accomplished by keeping the signal pair close together and physical separation from high-voltage, high-current, or high-frequency signals.

In summary, follow these guidelines in board layout for keeping differential noise to a minimum.

- Keep the differential input traces short.
- Match the length, physical dimensions, and routing of each line of the pair.
- Keep the lines close together.
- Match components connected to each line.
- Separate the inputs from high-voltage, high-frequency, or high-current signals.

TEST MODE DRIVER DISABLE

If the input signal to the D pin is such that:

1. the signal has signaling rate above 4 Mbps (for the ‘HVD21 and ‘HVD24)
2. the signal has signaling rate above 6 Mbps (for the ‘HVD20 and ‘HVD23)
3. the signal has average amplitude between 1.2 V and 1.6 V (1.4 V ±200 mV)
4. the average signal amplitude remains in this range for 100 µsec or longer,

then the driver may activate a test-mode during which the driver outputs are temporarily disabled. This can cause loss of transmission of data during the period that the device is in the test-mode. The driver will be re-enabled and resume normal operation whenever the above conditions are not true. The device is not damaged by this test mode.

Although rare, there are combinations of specific voltage levels and input data patterns within the operating conditions of the HVD2x family which may lead to a temporary state where the driver outputs are disabled for a period of time.

Observations:

1. The conditions for inadvertently entering the test mode are dependent on the levels, duration, and duty cycle of the logic signal input to the D pin. Operating input levels are specified as greater than 2 V for a logic HIGH input, and less than 0.8V for a logic LOW input. Therefore, a valid steady-state logic input will not cause the device to activate the test mode
2. Only input signals with frequency content above 2 MHz (4 Mbps) have a possibility of activating the test mode. Therefore, this issue should not affect the normal operation of the HVD22 (500 kbps).
3. For operating signaling rates of 4 Mbps (or above), the conditions stated above must remain true over a period of: 4 Mbps x 100 µsec = 400 bits. Therefore, a normal short message will not inadvertently activate the test model
4. One example of an input signal which may cause the test mode to activate is a clock signal with frequency 3 MHz and 50% duty cycle (symmetric HIGH and LOW half-cycles) with logic HIGH levels of 2.4 V and logic LOW levels of 0.4 V. This signal applied to the D pin as a driver input would meet the criteria listed above, and might cause the test-mode to activate, which would disable the driver. Note that this example situation might occur if the clock signal were generated by a microcontroller or logic chip with a 2.7 V-supply.

REVISION HISTORY

Changes from Original (December 2002) to Revision A **Page**

- Changed t_{PZH}, t_{PHZ}, t_{PZL}, and t_{PLZ} - From a MAX value of 120 To include TYP and MAX values for each entry (RECEIVER SWITCHING CHARACTERISTICS table) 6

Changes from Revision A (March 2003) to Revision B **Page**

- Added V_{IK} TYP Value of 0.75V (DRIVER ELECTRICAL CHARACTERISTICS table) 4
- Deleted $V_{IT(F+)}$ - VCM = −20 V to 25 V MIN value (RECEIVER ELECTRICAL CHARACTERISTICS table) 5
- Added RECEIVER EQUALIZATION CHARACTERISTICS table 6
- Changed A Input circuit in the EQUIVALENT INPUT AND OUTPUT SCHEMATIC DIAGRAMS 8
- Added Figure 22, Figure 23, and Figure 24 to the TYPICAL CHARACTERISTICS 15
- Changed the INTEGRATED RECEIVER EQUALIZATION USING THE HVD23 section 19
- Changed the INTEGRATED RECEIVER EQUALIZATION USING THE HVD24 section 20

Changes from Revision B (June 2003) to Revision C **Page**

- Added the THERMAL CHARACTERISTICS table 14
- Added the THEORY OF OPERATION section 17
- Added the NOISE CONSIDERATIONS FOR EQUALIZED RECEIVERS section 21

Changes from Revision C (September 2003) to Revision D **Page**

- Added Conditions note to the ABSOLUTE MAXIMUM RATINGS table "over operating free-air temperature range (unless otherwise noted)" 3
- Deleted Storage temperature, T_{stg} from the ABSOLUTE MAXIMUM RATINGS table 3
- Added Receiver output current, I_O to the ABSOLUTE MAXIMUM RATINGS table 3

Changes from Revision D (April 2005) to Revision E **Page**

- Changed I_O - Added test condition and values per device number (DRIVER ELECTRICAL CHARACTERISTICS table) 4
- Replaced the Dissipation Rating table with the THERMAL INFORMATION table 14
- Changed the THERMAL CHARACTERISTICS table to POWER DISSIPATION table 14
- Added the TEST MODE DRIVER DISABLE section 22

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
